## MAJOR PROJECTS (\* – ONGOING, \*\* – COMPLETED)

- **\*Bayesian calibration and uncertainty quantification** (at UT Austin)
  - Proposed a Bayesian inference scheme for the calibration of PDE-based models that utilizes goal-oriented a-posteriori estimates [JhaOden-JCP-2022](#)
  - Faster MCMC parameter sampling by utilizing computationally faster approximations of the error in QoIs
  - Modeling “model inadequacy” (correction) in a Bayesian inference in which the high-fidelity model is replaced with surrogate models (manuscript in preparation)
  - Correction is designed to enhance the application of neural network surrogates in Bayesian inference (examples include nonlinear Poisson equation and hyperelasticity)
- **\*Multiphysics modeling of tissue-scale tumor growth** (at UT Austin)
  - Developed a 3D-1D model of tumor growth and angiogenesis coupling evolution of tumors with the flow in tissue and vascular network [Nonlin-2021](#), [CMAME-2021](#)
  - 1D Poiseuille flow model and Darcy’s law to simulate the flow in a vascular network and tissue domain, respectively
  - Evolution of tumors, proteins, and drugs based on continuum mixture theory and phase-field method
- **\*Optimal experimental design for Hyperpolarized (HP) MRI** (at UT Austin)
  - Determining HP scan parameters (design parameters) such as flip angles and repetition times is non-trivial due to the signal decay and instantaneous signal loss during a scan
  - Proposed a method based on mutual information to determine the optimal design parameters that increase the information content of data [JhaFuentes-MRM-2022](#)
  - Received a grant of \$50k as a co-PI (D. Fuentes as PI) for the duration Sep 2020 – Mar 2022
- **\*High fidelity model for granular media** (at UT Austin)
  - Existing models based on the Discrete Element Method (DEM) are restricted to spherical particles, and can not handle particle breakage
  - Combined peridynamics (nonlocal theory of fracture) and DEM and proposed a novel high-fidelity model called PeriDEM that overcomes the limitations of DEM-based models [JMPS-2021](#)
  - Open-source software available on GitHub ([PeriDEM](#))
- **\*Relating peridynamics and classical linear elastic fracture mechanics (LEFM)** (at UT Austin and LSU, Baton Rouge)
  - Establishing a connection between LEFM and peridynamics is of great interest for a wider integration of peridynamics to practical applications; further, such endeavors have potential to increase our understanding of fracture
  - We showed that peridynamics satisfies the LEFM energy relation [JhaLipton-IJFrac-2021](#), [LiptonJha-Nonlin-2021](#), [LiptonJha-JPER-2019](#)
  - In the absence of fracture, peridynamics approximates elastodynamics [JhaLipton-IJNME-2018](#)
  - Obtained a CFL-like stability condition for an explicit time discretization of peridynamics [JhaLipton-IJNME-2018](#)
- **\*\*Numerical method and analysis of peridynamics theory of fracture in solids** (at LSU, Baton Rouge)
  - Implemented and studied numerical methods such as finite difference and finite element for peridynamics [JhaLipton-SINUM-2018](#), [JhaLipton-DCDSB-2021](#), [JhaLipton-CMAME-2019](#)
  - Showed that the numerical solution converges to the exact solution as expected (important contribution as such results were not clearly established prior to our work)
- **\*\*Multiscale modeling of electrical interaction in ionic solids** (at CMU, Pittsburgh)
  - Coulombic interaction is long-ranged and it’s integration with multiscale methods, e.g., Quasicontinuum method, is difficult
  - Obtained a continuum limit approximation of Coulombic (electrostatic) interaction and utilized the limiting energy to develop a Quasicontinuum method with electrostatic interaction [JhaDayal-ContinuumLimit](#), [Jha-PhDThesis-2016](#)
- **\*\*Discrete-to-continuum limit of electrostatic interaction in nanostructures** (at CMU, Pittsburgh)
  - Performed a rigorous derivation of continuum limit of electrostatic interaction in nanostructures with rotational and translational symmetries [JhaDayal-ContinuumLimit](#)
  - Unlike in the case of 3D crystal structures, the limiting electrostatic energy in nanostructures is local
  - The limiting energy includes contributions from both the tangential and normal components of the dipole moment field; tangential components not present in the limiting energy obtained through dimensional reduction techniques
- **\*\*Monolithic fluid-structure interaction (FSI) formulation** (at IISc, Bangalore)
  - Developed a monolithic arbitrary Lagrangian-Eulerian (ALE) formulation for FSI problems
  - Compressible fluid and nonlinear solid undergoing large deformation
  - Mapped the Navier-Stokes equations for compressible fluid to the reference configuration
  - Developed energy conserving time discretization and finite element spatial discretization of nonlinear coupled partial differential equations
