SUMMARY

My research uses mechanics, applied mathematics, and computational science to understand and represent the complex behavior of materials, e.g., multiphysics effects in materials, material damage, crack propagation, and high-fidelity simulation of granular media involving arbitrarily shaped particles and particle breakage. My interests include the mechanics of smart materials, focusing on functional soft and granular materials.

 - Open-source software available on GitHub ([PeriDEM](#)).

 - Showed that the numerical solution converges to the exact solution as expected (an important contribution as such results were not clearly established before our work).
- **Multiscale modeling of electrical interaction in ionic solids** (at CMU, Pittsburgh)
 - Coulombic interactions are long-ranged, and it is challenging to integrate them with multiscale (e.g., Quasicontinuum) methods;
 - Obtained a continuum limit approximation of Coulombic (electrostatic) interaction and utilized the limiting energy to develop a QC method with electrostatic interaction [JhaEtAl-JAM-2022](#), [JhaBreitzmanDayal-ARMA-2023](#).

 - Performed a rigorous derivation of continuum limit of electrostatic interaction in nanostructures with rotational and translational symmetries [JhaBreitzmanDayal-ARMA-2023](#);
 - Unlike in the case of 3D crystal structures, the limiting electrostatic energy in nanostructures is local;
 - The limiting energy includes contributions from both the tangential and normal components of the dipole moment field; tangential components not present in the limiting energy obtained through dimensional reduction techniques.
- **Monolithic fluid-structure interaction (FSI) formulation** (at IISc, Bangalore)
 - Developed a monolithic arbitrary Lagrangian-Eulerian (ALE) formulation for FSI problems;
 - Compressible fluid and nonlinear solid undergoing large deformation;
 - Mapped the Navier-Stokes equations for compressible fluid to the reference configuration;
